Gaging Systems

Motorized Valve Seat Measurement System (Roundness of the Seat and Runout of Seat to Guide)

The hand held motorized valve seat gage allows ease of use with very accurate results that are not influenced by the operator. When the unit is placed into the part a cycle will automatically start. The motor driven head rotates and provides a total indicated reading of the roundness of the seat and the runout of the seat to the valve guide. The readings are taken from two very small transducers integrated into the read head. If you need an accurate and economical solution to inspect valves seats, VGAGE has the solution for you.
